

FlyRank Week 2 – Frame It as Cases

Voice Card

Practical, clear, honest, curious, evidence-based, approachable

Claude Project Standing Instruction

Write in a practical, clear, honest, curious, evidence-based, and approachable voice. Use simple language, avoid buzzwords, preserve my wording, and explain decisions and evidence rather than exaggerating achievements.

Research Question & Provisional Lane

Problem

The internship required selecting a meaningful ML problem supported by the available data.

What I Did

I chose Refresh / Content Opportunity Scoring, explored the dataset, and framed a research question around identifying pages that may deserve human review. I explained the business decision, action, and why ML could support prioritization.

Outcome

I produced a documented research question that became the foundation for later ML work.

ML Task Framing

Problem

I needed to translate the business problem into an ML task.

What I Did

I framed it as a binary classification problem, created a proxy target, selected ROC-AUC, and showed the unit of analysis.

Outcome

The notebook clearly connects the business problem to a practical ML workflow.

First Look and Discovery

Problem

I needed to understand the dataset before modeling.

What I Did

I explored the data, summarized statistics, checked missing values, and investigated search-performance features.

Outcome

The exploration identified useful signals for future models.

Your First Readable Model

Problem

I needed to compare a manual rule with an interpretable ML model.

What I Did

I trained a decision tree, interpreted its decisions, compared it with a manual rule, and learned about data leakage.

Outcome

The project strengthened my understanding of explainable machine learning.

AI Workflow Audit & Tool Setup

Problem

I wanted a repeatable AI-assisted workflow.

What I Did

I audited my workflow, configured a Claude Project, and completed the first Anthropic Academy module.

Outcome

I created a structured workflow for future projects.

Bio

I'm an IT and Statistics graduate building practical skills in machine learning, data analysis, and AI through hands-on projects. I focus on understanding data, framing ML problems, and communicating evidence clearly.

Contact / Call to Action

If you're looking for a junior machine learning candidate who enjoys learning through practical projects, please explore my GitHub portfolio.

Before / After

Generic AI Version

I am a results-driven AI professional passionate about leveraging cutting-edge machine learning technologies to deliver innovative, scalable solutions.

My Edited Version

I learn machine learning by building practical projects, documenting my decisions, and explaining what the data can—and cannot—support. My goal is to help people make better decisions using evidence rather than assumptions.
