

I demonstrate practical machine learning skills by using Python and data analysis workflows to explore datasets, build beginner-level machine learning models, and communicate data-driven insights for real-world decisions. This proof is created for a Machine Learning hiring manager looking for a junior AI/ML candidate who can apply technical knowledge to practical problems and continue learning quickly. The main action I want them to take is to review my GitHub portfolio and consider me for a machine learning internship or entry-level opportunity. A CV or LinkedIn profile can show my education and list technical skills, but it cannot prove my ability to work through real datasets, build experiments, document my process, and learn through practical projects.
